## TURBULENCE

### AN EXAMPLE TAKEN FROM A STUDY OF THE SEA

by F. MODEL, of the Deutsche Seewarte.

We beg to draw the attention of our readers to this article which appeared in pamphlet IV of the *Annalen der Hydrographie* for 1944, page 97, and also to an article by P. Raethjen, which appeared in pamphlet V, for the same year. These articles deal with a problem often met with in Oceanography and about which observation result have rarely been made public. By showing the progress of this phenomenon, they make it possible to subject it to measurements and to estimate the magnitude and frequency of movements which produce mixtures of waters of different temperature and salinity.

P. V.
