

A SIMPLE METHOD OF SURVEYING FROM AIR PHOTOGRAPHS

by

LIEUT. J.S.A. SALT, R.E., RESEARCH OFFICER, AIR SURVEY COMMITTEE.
 Professionnal Papers of the Air Survey Committee, No.8.

(Published by H. M. S. O., London, 1933 — 8vo, 145 pp. Plates and 46 Figs.).

PARALLAX TABLES

(Supplement to above, 82 pages).

The evolution of aerial photography as applied to topography has necessitated a recasting of the various publications issued by the BRITISH AIR SURVEY COMMITTEE. This Committee has given most of its attention to the production of medium scale maps whose contours are drawn with sufficient accuracy, while making use of comparatively simple instruments to co-ordinate the work of aerial photography, ground survey and drawing.

The object of the present volume is threefold :

(i) To make clear to the air photographer the demands made upon him by the surveyors; these are stated in chapter III. (ii) To give the surveyor an idea of the intimate relation between the survey work carried out on the ground and the plotting processes based upon it, carried out subsequently in the office. This information will be sufficient to enable him to plan his field work to the best advantage both for himself and the cartographer. (iii) The book finally forms a manual for the cartographer who makes use of the photographs, giving the principles underlying the construction of a map from air photography and a definite procedure to be followed in plotting.

An index at the end of the book contains references to other Professional Papers of the AIR SURVEY COMMITTEE relating to the same subject, such, for example, as the treatise entitled *Surveying from Air Photographs* by Captain M. HOTINE, R.E.

L'ASTROLABIO A PRISMA — DESCRIZIONE ED USO

(THE PRISM ASTROLABE — DESCRIPTION AND USE).

by

PROFESSOR G. FORNI, CHIEF OF THE DEPARTMENT OF ASTRONOMY-GEODESY
 OF THE ISTITUTO IDROGRAFICO DELLA REGIA MARINA, GENOA.

(In 8vo - 44 pages - 10 fig. - 4 tables - Istituto Idrografico della Regia Marina, Genova - 1932).

The equal altitude method recommended at a comparatively early date by GAUSS received a new impulsion when the prismatic astrolabe appeared towards the year 1903; improved by Messrs. CLAUDE and DRIENCOURT in 1910, the use of the astrolabe became general in 1916 concurrently with the introduction of wireless telegraphy. Colonel WOODROFFE, in an article entitled *The Astrolabe and Wireless* which appeared in the *Geographical Journal* of May 1916, refers to its application. In 1919 there was published in Egypt *A Handbook of the Prismatic Astrolabe* by Drs. J. BALL and H. KNOX-SHAW; during 1926 the astrolabe was extensively used in connection with the international operations for the determination of longitudes (1).

Improvements in the prismatic astrolabe carried out in England, at the instigation of Captain T. Y. BAKER have been mentioned in the *Hydrographic Review* (2).

(1) Armand Lambert: *La participation française à la révision des longitudes mondiales* — Oct.-Nov. 1926.

(2) See *Hydrographic Review*, Vol. IX, N° 1, May 1932, page 218.

Professor G. FORNI's work published last year by the HYDROGRAPHIC INSTITUTE OF THE ROYAL ITALIAN NAVY takes the form of a precise handbook of observations by means of the astrolabe. It gives the description and method of use of the JOBIN instrument and of the instrument constructed by the S. O. M. (SOCIÉTÉ D'OPTIQUE ET DE MÉCANIQUE DE HAUTE PRÉCISION, Paris).

For the computation of observations by prismatic astrolabe the Italian Hydrographic Institute has adopted the JORDAN formula by means of which the computations of distance from the estimated position to the position line given by the astrolabe observation, may be easily estimated. An example of computation is given in the work.

For the preparation of the programme of observations the Italian Hydrographic Institute has adopted a graphic procedure worked out by Admiral TONTA; this procedure, which makes use of stellar plans of the northern and southern hemispheres in stereograph-polar projection and of a graph representing the almucantar of 30° zenithal distance corresponding to the station position, is described on pp. 40-45 of Professor FORNI's publication; by its means the list of sidereal times and azimuths of the different stars observable passing at the zenithal distance of 30° is very readily established.

THE ASTROLABES OF THE WORLD

by

Dr. ROBERT T. GUNTHER

Vol. 1: *The Eastern Astrolabes*. Pp. xvii + 304, 68 plates

Vol. 2: *The Western Astrolabes*. Pp. viii + 305-609, plates 69-153

(Oxford: Printed at the University Press, 1932, £10.10s. net)

Dr. Robert T. GUNTHER, Curator of the Lewis Evans Collection in the Old Ashmolean Museum at Oxford, has published a general Catalogue of the astrolabes of the world based upon the series of instruments in the LEWIS EVANS Collection in the old Ashmolean Museum at Oxford, with notes on astrolabes in the collections of the BRITISH MUSEUM, the SCIENCE MUSEUM, Sir J. FINDLAY, Mr. S. V. HOFFMAN, the MENSING collection, and in other public and private collections.

He begins with the astrolabes of Greece, Byzantium, Persia, India, Arabia, and Morocco in Volume I, which is devoted to the astrolabes of the East, and continues with those of Spain, Italy, France, the Low Countries, Germany and England in Volume II (*The Western Astrolabes*). Under each of these heads, dated instruments are arranged in order of antiquity, but there are also numerous interesting examples to which no exact date can be assigned.

This interesting publication constitutes a valuable contribution to the history of the astrolabe.

A NEW READING MICROSCOPE.

In the *Zeitschrift für Instrumentenkunde* 53.4, page 159, is a description by Engineer H. WEDEMEYER of Göttingen of a reading microscope suitable for the reading of the divided circles on theodolites, universal transits, and particularly suitable also for the reading of the graduations of the stadia in levelling instruments.

This new reading microscope is distinguished from the known appliances in that no micrometer screws are employed and that, hence, no kind of error can ensue through wear. It consists essentially of a reading microscope of standard design in the focussing plane of which there are two small graduated plates, one of which may be rotated from outside by means of a milled ring at the eye-end of the telescope. The fixed graduated
